Future Directions in Arctic Research

Science Support Needs

Michael Weintraub

University of Toledo

Department of Environmental Sciences

Arctic springs are warmer & snow is melting earlier

Arctic Report Card 2011:

- Strong trend from 1966 - 2011 of less spring snow cover due to earlier melt
- The start date of snow cover over the Arctic has been stable
- Similar trends in declining spring snowmelt for Eurasian & N. American arctic

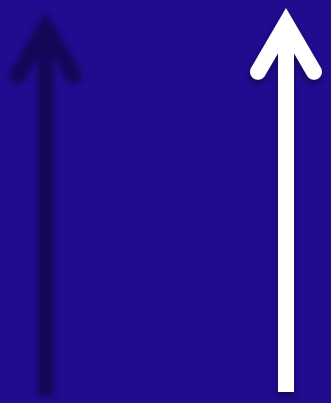
16 - 20

CO_2?



Climate change will continue to be the focus of terrestrial ecosystem ecology

With emphases on:

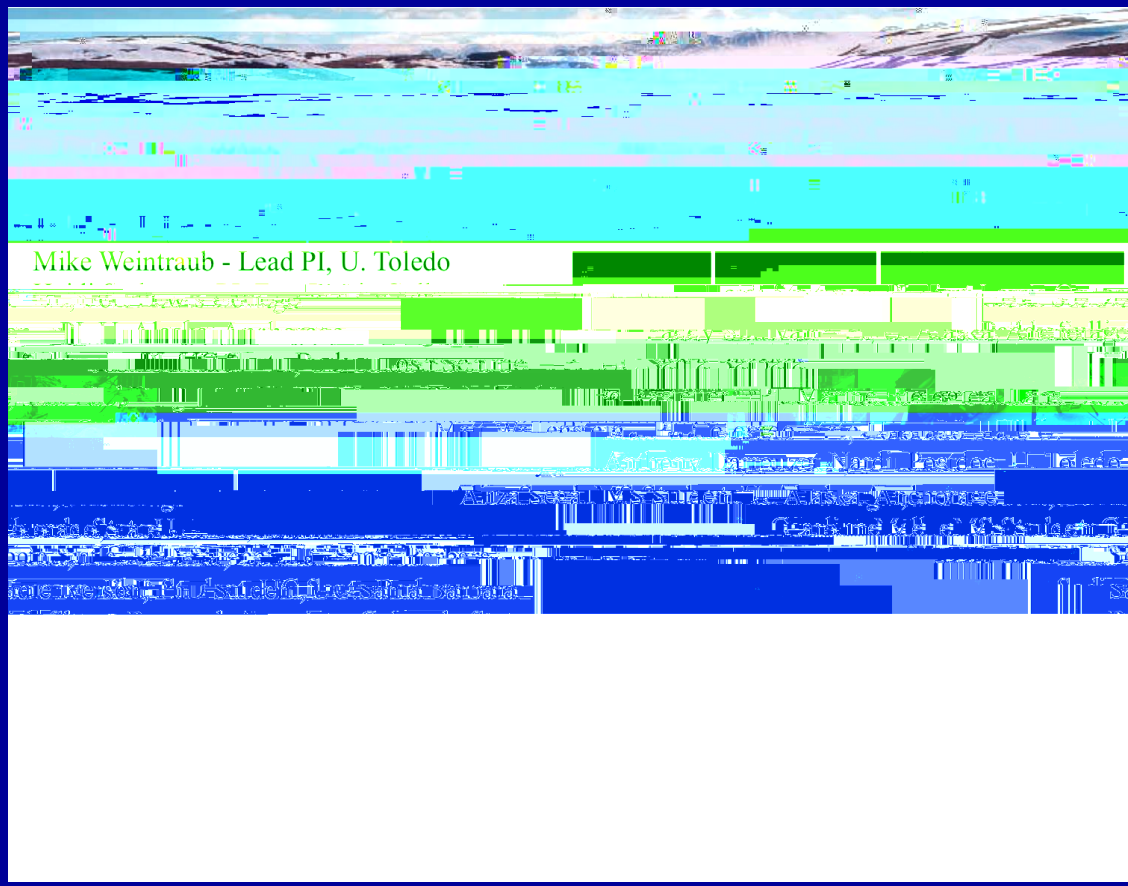
- Changes in plant productivity and community composition
- Soil C losses due increased SOM decomposition
- The impacts of disturbances such as thermokarsts

Future Research Needs

More large multi-investigator projects

Associated Needs:

- More complex logistics
- Transportation
- More on site support
- More lab space per group – more people and more measurements
- Office space for students and teachers



More large manipulative field experiments

- More complex logistics
- Deploying heavy equipment to field sites
- More lab space at TFS
- Protecting the tundra
- Paying attention to the legacy of field manipulations after projects end

Greater Reliance On Automated Sensors & Chambers

- Data management & archiving
- Deploying heavy equipment to field sites
- Power (sometimes)
- Remote data downloading
- Data archiving – Advanced - Cooperative Arctic Data and Information Service?
- Winter warm storage (sometimes)

Broader Geographic Distribution Of Research Sites

- More complex logistics
- Greater transportation needs
- Deploying equipment to more field sites
- Power (sometimes)
- Protecting more tundra

GIS

Maintaining long term records of research across
